Reference Power Level Comparison

Creos determines the financially optimal reference power level from the 15-minute load curve. This comparison recomputes the fixed charge and exceedance charge for each standard reference power level while keeping the other invoice items unchanged. One reference power level is applied to the full selected period.

Financially optimal: 12 kW

REFERENCE POWER LEVEL	FIXED CHARGE	EXCEEDANCE CHARGE	ESTIMATED TOTAL	DIFFERENCE VS CURRENT
3 kW	7.42 EUR	23.31 EUR	**155.53 EUR**	**+11.86 EUR**
7 kW	12.84 EUR	10.4 EUR	**147.44 EUR**	**+3.77 EUR**

This estimate uses your configured billing rates for the selected period. Variable electricity charges are applied to energy bought from the grid (639.49 kWh), not total home usage. Supplier pricing: 0.1125 EUR/kWh. Fixed monthly charges are prorated across the viewed period (31 days, full month, equivalent to 1 monthly charges). Peak load (13 kW) is compared against your reference power level (12 kW) — every kWh above the reference power level is billed with an exceedance charge of 0.0765 EUR/kWh. Adjust rates in Settings.

Self-consumption savings = energy you produced and used yourself instead of buying from the grid. Extra vs exporting instead = how much more or less those self-consumed kWh were worth compared with selling them at the feed-in rate. These savings are informational here and already reflected in the main invoice because only grid-imported energy is billed. Reference-power savings = exceedance charges avoided because solar reduced the net load seen against your reference power during the same 15-minute interval. Feed-in revenue = money earned by selling surplus production. Using fixed feed-in tariff — configure a market price sensor in Settings for real-time rates. Displayed per-meter feed-in kWh are currently equal-split estimates because per-meter export data is not yet available.
